Changes in the Aging Foot

“When our feet hurt, we hurt all over.”
Socrates
The Foot is composed of

- 26 bones
  - 25% of all the bones in the body!
- 33 joints
- 120 intertwining web of muscles, ligaments and bone
Function of the feet

1. Support the body’s weight
2. Act as a shock absorber
3. Serves as a lever for propulsion forward
4. Maintains balance adjusting to uneven surfaces
As one ages the ability to ambulate is directly related to foot health.
Sustained mobility often enables older adults to maximize their independence and ability to socialize.
Think About It…

- Average person takes
  - 10,000 steps/day
  - Or $x > 3,000,000$ steps/year
  - With each step force of impact is 2-3x body weight

- 18,000 individuals die each year from injuries sustained by a fall
FOOT PROBLEMS

- According to the US National Center for Health Statistics (NCHS), impairment of the lower extremities can cause activity limitations in the elderly.
- Studies show that care for a bedridden patient costs much more than care for an ambulatory patient.
- To maintain and preserve quality of life one must be able to move about to get from point to point.
- Mobility is a vital ingredient to independence and a higher quality of life.
- Foot problems can make it difficult or next to impossible for seniors to perform activities of daily living and social activities.
Mirror of Health

- Normal aging leads to deficits in the vascular, skeletomuscular, and nervous systems.
- The feet are often the first to see signs of systemic conditions.
- There are more than 300 different foot ailments. Some can be traced to heredity, the aging process, or may stem from the effect of years of neglect and/or abuse.
- 90% of the population over the age of 65 have evidence of foot pain that alters independent activity.
General Changes in Feet During Aging

- With age, feet tend to spread, and lose the fat pads that cushion the bottom of the feet.
- Increase in weight affects the bone and ligament structure.
- Skin has decrease hair growth, oil secretion, and nail growth is thickened with longitudinal ridges.
Common Foot Problems Associated with Aging

- **Inappropriate shoe gear**
  - Larger feet

- **Skin Conditions**
  - Loss of hair growth below knee, top of the foot and toes
  - Dry, thin skin
  - Increased areas of pigmentation
  - Hyperkerotic lesion corns and calluses
  - Ingrown toenails
Common Foot Problems Associated with Aging

- **Toenails**
  - Degenerative changes (onychopathy)
  - Thickening (onychochauxis & onychogryphosis)
  - Longitudinal ridging (onychorrhexis)
    - Microtrauma
    - Disease
    - Nutritional impairment
  - Fungal infection (onychomycosis)
Common Foot Problems Associated with Aging

- **Skeletal-muscular pain**
  - There is progressive muscle mass loss and soft tissue atrophy that leads to:
  - Structural abnormalities
    - Bunions
    - Hammertoes
    - Metatarsalgia
    - Heel pain
    - Fat pad atrophy
  - Arthritis
Common Foot Problems Associated with Aging

Nerve disorders
- Morton Neuroma
- Neuropathies
- Paresthesias
  - Abnormal skin sensations
- Reduced deep tendon reflexes
- Autonomic Nervous system changes
  - Decreased sweating and oil production
Systemic Diseases That Manifest On The Lower Extremity

- Diabetes
  - Neuropathy, Ischemia, Muscle weakness, Skin changes

- Arthrosclerosis
  - Skin changes, edema, pain
  - Reynaud's Disease

- Thromboembolic diseases
  - Blood clots i.e. strokes, DVT

- Hypothyroidism

- Congestive Heart Failure
Systemic Diseases That Manifest On The Lower Extremity

- Renal Failure
- Lymphedema
- Arthritis
  - Osteoarthritis, Rheumatoid, Gouty
- Anemias
  - Iron deficiency
  - B Vitamin deficiency
  - K Vitamin deficiency
Systemic Diseases That Manifest On The Lower Extremity

- Active Chemotherapy
- Chronic Steroid Therapy
- Immunosuppression
- Alzheimer's Disease
- Parkinson's Disease
AGING
Between 40 and 50

- Bone density begins to decrease more rapidly in women
- Articular cartilage becomes more brittle
- Connective tissue losses tensile strength, elasticity and regenerative properties
- Muscle mass decreases even with continued activity
- Body weight increases
- Skin becomes drier, with decreased hair growth and thickening of the nails
Skin

- Dry skin
- Corns and calluses
- Fungal and Bacterial Conditions
- Warts
- Loss of plantar fat pad
- Decreased small vessels
- Decreased small fibers
Vascular system arterial

The Age of Your Arteries

In your 20s, your arteries are generally healthy and clear of obvious disease, though research shows the disease and pain process has already begun. Harm from tobacco smoke, cholesterol and sedentary lifestyle can be accumulating.

In your 30s and 40s, accumulation of fatty deposits called plaque typically begins to accumulate in men. Women are generally protected in their major arteries until after menopause though disease may begin in smaller vessels. Cholesterol, tobacco smoke, high blood pressure and high blood sugar all cause permanent injury to the inner lining of the artery.

In your 50s, the assault on the inner lining of the arteries continues while the vessel wall becomes stiffer and more fibrous. High blood pressure causes damage apart from plaque build-up that makes arteries less elastic or compliant, increasing the workload on the heart. Inner tissue becomes scoured and clogged. For women, when disease tends to develop 10 to 15 years later than for men, the accumulation of plaque begins to accelerate.

In your 60s and beyond, the aging process, partly reflecting the arteries withstanding more than 100,000 heart beats a day, contributes to the attack on the lining of the arteries. Meanwhile, left untreated, fatty plaques can rupture or erode, leading to blood clots that can cause heart attacks, while an overworked or scarred heart increases the risk of heart failure.

Artery damage can be prevented or significantly mitigated by regular exercise, a healthy diet, refraining from smoking and adherene to heart medicines.

Sources: Colin J. Puskin, University of Florida; WJS reporting; Illustration: Shik Bhattacharya/The Wall Street Journal
Vascular system Venous
Connective Tissue

- Calcium pyrophosphate crystals tend to deposit around chondrocytes as we age leading to brittle articular cartilage
- Decreased thickness
- Collagen becomes stiffer
  - Glycation end products increase and this increases cross linkages
- Arthritis
Muscle

- Number and size of muscle fibers decreases
  - Fast contracting > slow contracting
  - Decrease is due to
    - Decrease in activity
    - Loss of motor units
    - Decrease in anabolic hormones
      - Growth hormone
      - Insulin like growth factor testosterone and DHEA

Balance and Strength Issues
- Pelvic, Posterior Calf, and Intrinsic
Bone Density

- Cortices become thinner from the inside and there is a decrease in cancellous bone
  - Senescent bone loss
    - aging impaired ability to absorb calcium from intestines – Vitamin D levels important
  - Sex hormones inhibit cytokines IL-1, IL-6 and TNF (males linear, females exponential)
## Summary of the effects of Aging

<table>
<thead>

These changes lead to
Cold Feet

- Muscle mass decrease with age
  - Females > males

- Skin thins
  - Starts at about age 40
  - Females > males

- Raynauld’s Phenomena / Disease

- Anemia
  - Iron deficiency
  - Vitamin B deficiency

- Blood Coagulation Abnormalities
  - Vitamin K deficiency
Edema

- **Edema**
  - Medication side effect or
  - Non-pitting edema will spring back quickly suggesting hepatic or renal disease or malnutrition.
  - Pitting edema retains the pit for more than a minute suggesting cardiac disease, CHF or inflammation.

- **Edema can also suggest:**
  - Diffuse edema with redness and warmth suggests DVT, superficial thrombophlebitis, or cellulitis
  - Brawny hyperpigmented skin suggests chronic venous insufficiency.
  - Purpuric chevron over the lateral malleolus suggests a ruptured Baker’s cyst.

- **Treatment**
  - Support hose 15-25 mmHg
Skin changes

- Dry Skin
- Corns and Calluses
- Fungal and Bacterial Conditions
- Warts
- Loss of plantar fat pad
- Decreased sensation
Painful Forefoot

- Digital deformities: Bunions, hammertoes
- Tenderness of the great toe plantar suggests sesamoiditis.
- Tenderness over the dorsal aspect of the metatarsal heads suggests stress fracture.
- Discrete tenderness over the dorsal aspect of the second metatarsal head is Freiberg's infarction (AVN).
- Tenderness to palpation over the plantar aspect of the metatarsal heads is metatarsalgia.
- Burning pain between the 3rd and 4th toes at the MTPJ suggests Morton's neuroma
- Pain on flexing the toes suggests an inflammatory lesion of the arch of the foot (Strunsky's sign).
**Medial Foot Pain**

- Tenderness and swelling at the base of the second metatarsal after injury indicates Lisfranc's fracture.
- Swelling and tenderness of medial ankle suggests medial ankle sprain or posterior tibialis tendonitis.
- Navicular tenderness suggests bursitis.
- Pain and tingling over the medial and plantar aspects of the foot suggests the tarsal tunnel syndrome.
- Increased pain on squeezing the malleoli together or pain on rotation of the foot at the ankle suggests a syndesmotic sprain.
Lateral Foot Pain

- Swelling and tenderness of the lateral malleolus to palpation suggests sprain or distal fibular fracture.
- Consider a peroneal retinaculum sprain if the tenderness is at the posterior lateral malleolus.
- Tenderness at the base of the fifth metatarsal bone suggests avulsion fracture, bursitis, Jones’ fracture.
Painful Heel

- Tenderness and swelling deep to the Achilles tendon between the tendon and the calcaneus suggests retrocalcaneal bursitis.
- Tenderness of the overlying skin over the distal third of the Achilles tendon suggests tendo-Achilles tendinitis.
- Diffuse tenderness of the Achilles tendon suggests Achilles tendinitis.
- Tenderness plantar medial heel suggests plantar fasciitis.
What can we do

- Eat Right
- Lose Weight
- Stay Active
- Take Care of Problems
  - Ignoring them doesn’t make them go away, but increases the potential of complications!
Better Diets

- Remember the food pyramid!
- Watch your caloric intake!
Better Diets

- Iron deficiency
  - Pumpkin seeds, nuts, fish, and watermelon

- B Vitamin deficiency
  - B complex supplement

- K Vitamin deficiency
  - Ginger, fish, parsley, salads, spring onion, apricots, and celery
Lose weight

- Pounds per square inch
  - Weight loss reduces hip, knee, ankle and foot pain!!

- “I can’t lose weight because my feet hurt!”
  - REALLY???!!!!!
Warm Up and Cool Down

- Drink 16 to 32 ounces of fluid 1 to 2 hours before exercise

- Break into a light sweat.
  - Do some light calisthenics and marching in place to get the blood flowing
  - Once you have loosened up by getting your body warm, you then begin to stretch.
  - By sweating, you are getting the blood pumping to your legs and arms

- Stretching is of paramount importance.
  - It should not hurt. If it does, you are probably being too aggressive or doing it improperly
  - **Stretching should be done before and after exercise**
Benefits of Exercise

- **In the Cardiovascular System, exercise**
  - Improves blood pressure and lipid profiles
  - Decreases risk of CAD
  - Improves CHF symptoms and decreases hospitalization rate

- **In Diabetes Mellitus, type 2, exercise**
  - Decreases incidence
  - Improves glycemic control, and insulin sensitivity

- **In Osteoporosis, exercise**
  - Increases bone density
  - Decreases hip and vertebral fractures
  - Decreases risk of falling
Benefits of Exercise

- **In Osteoarthritis, exercise**
  - Keeps joints, tendons and ligaments flexible
  - Improves function, and decreases pain

- **For Neuropsychologic health, exercise**
  - Improves quality of sleep, improves quality of life and decreases fatigue
  - Improves cognitive function and short-term memory
  - Decreases rates of depression
Benefits of Exercise

In Addition, exercise

- Decreases all-cause mortality and morbidity
- Decreases risk of obesity
- Improves symptoms in peripheral vascular occlusive disease
- Increases your energy and endurance
- Increases gastrointestinal motility
Strength Training

- Although the positive benefits of aerobic exercise are widely accepted, the importance of resistance training is becoming increasingly apparent.

- Muscle strength declines by:
  - 15% per decade after age 50
  - 30% per decade after age 70
    - The loss of muscle mass occurs in women > men
  - Resistance training can result in 25 to 100% strength gain in adults through muscle hypertrophy (growth) and, increased motor unit recruitment (use).
Active foot exercises

- Increase muscle bulk
- Increases circulation
- Decreases stiffness
- Increases balance
-Decreases gait disturbances
Most common foot exercises

- Toe curls with towel
- Toe extension
- Calf/heel stretch on stairs
- Standing calf/heel stretch
Additional exercises

- Marble Pick ups
  - Intrinsic muscles
    - Metatarsal pain

- Arch strengthener
  - Longitudinal arch

- Arch strengthener
  - Posterior tibial tendon
Skin changes ....Dry Skin

- Moisturize!
- Skin specific, but any good lotion or cream
  - Eucalyptus oil
    - Antimicrobial and antifungal
    - Stimulates circulation
    - Facilitates the production of ceramides in cells that increases skin softness and suppleness
Skin changes....Dry Skin

- Moisturize!
  - Menthol
    - 50% of essential oil in peppermint
    - Inhibits pain receptors
    - Dilates blood vessels
  - Squalenes
    - Precursors to cholesterol
    - 15% of total fat content of skin which declines with age
    - Olive oil is 0.2-0.7% squalenes
Skin changes....Dry Skin

- **Moisturize!**
  - Cocoa butter
    - Contains antioxidants called flavonoids
    - Appears to cause relaxation of veins
  - Shea Butter
    - Contains Vitamin E, an antioxidant
  - Coconut oil
    - High numbers of medium chain triglycerides
Skin changes….Dry Skin

- **Moisturize!**
  - **Aloe Vera**
    - astringent – causes contraction of the skin, blood vessels, and other tissues stopping the fluid discharge
    - Emollient - helps to soften and smooth the skin
    - Antifungal, antibacterial and antiviral
    - cell proliferation
Skin changes

- **Nail Changes**

- **Onychomycosis**
  - Fungal infections of the nail plate causing deformed and white or yellow discoloration of the nails
  - $\geq 10\%$ of population has onychomycosis
  - Risk factors include:
    - Male, PVD, Diabetes, aging immunocompromised
  - Treatment has a high failure rate
    - Systemic is associated with hepatotoxicity
      - Terbinafine and itraconazole
    - Topical
      - Herbal
      - Ciclopirox 8\%
Skin changes

■ **Calluses**
  - Are due to keratin dysfunction and persistent shear forces
  - **Treatment**
    - Should be smoothed lightly with an emery board or pumice stone

■ **If the dry skin does not resolve than its more than just dry skin**
  - **Fungal Infection**
    - Athletes foot
  - **Bacterial Infection**
    - erythrasma
  - **Systemic Disease**
    - Dermatitis
    - Psoriasis
The four “V’s” of skin care

- Vinegar
- Vicks Vapor Rub
- Vaseline
- Vegetable shortening
Shoes

- We change shoe size with aging
- Best to buy after 4:00pm to have maximal swelling
- Note tight shoes decrease circulation

Heels
- greater than 3” load the forefoot 7X that of body weight
- Lead to contracture of posterior calf musculature
Foot Health Tips

- Properly fitted shoes are essential
- Shop for shoes in the afternoon; feet tend to swell during the day.
- Never cut corns and calluses with a razor, pocket knife, or other such instrument
- Bathe your feet daily in lukewarm (not hot) water, using a mild soap, preferably one containing moisturizers, or use a moisturizer separately.
- Trim or file your toenails straight across.
- Inspect your feet every day or have someone do this for you.
- **FOOT PAIN IS NOT NORMAL HAVE IT CHECKED**
Thank you
